

# **GCE A LEVEL MARKING SCHEME**

**SUMMER 2023**

**A LEVEL  
GEOLOGY – COMPONENT 3  
A480U30-1**

## **INTRODUCTION**

This marking scheme was used by WJEC for the 2023 examination. It was finalised after detailed discussion at examiners' conferences by all the examiners involved in the assessment. The conference was held shortly after the paper was taken so that reference could be made to the full range of candidates' responses, with photocopied scripts forming the basis of discussion. The aim of the conference was to ensure that the marking scheme was interpreted and applied in the same way by all examiners.

It is hoped that this information will be of assistance to centres but it is recognised at the same time that, without the benefit of participation in the examiners' conference, teachers may have different views on certain matters of detail or interpretation.

WJEC regrets that it cannot enter into any discussion or correspondence about this marking scheme.

**GCE A LEVEL GEOLOGY**  
**COMPONENT 3 - GEOLOGICAL APPLICATIONS**  
**SUMMER 2023 MARK SCHEME**

**Instructions for examiners of A Level Geology when applying the mark scheme**

**1 Positive marking**

It should be remembered that candidates are writing under examination conditions and credit should be given for what the candidate writes, rather than adopting the approach of penalising him/her for any omissions. It should be possible for a very good response to achieve full marks and a very poor one to achieve zero marks. Worthwhile answers that meet the requirements of the question, but do not appear on the mark scheme are to be given credit.

**2 Tick marking**

Low tariff questions should be marked using a points-based system. Each credit worthy response should be ticked in red pen. The number of ticks must equal the mark awarded for the sub-question. The mark scheme should be applied precisely using the marking details box as a guide to the responses that are acceptable. Do not use crosses to indicate answers that are incorrect.

**3 Annotated diagrams**

Where a candidate has answered a question wholly or partly by use of an annotated diagram, credit must be awarded to the annotations which form credit-worthy responses as outlined in the marking details box. Candidates must be credited only once for valid responses which appear both as annotations to diagrams and within a section of prose in the answer to the same question.

**4. Banded mark schemes**

Banded mark schemes are divided so that each band has a relevant descriptor. The descriptor for the band provides a description of the performance level for that band. Each band contains marks. Examiners should first read and annotate a candidate's answer to pick out the evidence that is being assessed in that question. **Do not use ticks** on the candidate's response. Once the annotation is complete, the mark scheme can be applied. This is done as a two-stage process.

## **Stage 1 – Deciding on the band**

When deciding on a band, the answer should be viewed holistically. Beginning at the lowest band, examiners should look at the learner's answer and check whether it matches the descriptor for that band. Examiners should look at the descriptor for that band and see if it matches the qualities shown in the learner's answer. If the descriptor at the lowest band is satisfied, examiners should move up to the next band and repeat this process for each band until the descriptor matches the answer.

If an answer covers different aspects of different bands within the mark scheme, a 'best fit' approach should be adopted to decide on the band and then the learner's response should be used to decide on the mark within the band. For instance if a response is mainly in band 2 but with a limited amount of band 3 content, the answer would be placed in band 2, but the mark awarded would be close to the top of band 2 as a result of the band 3 content.

Examiners should not seek to mark candidates down as a result of small omissions in minor areas of an answer.

## **Stage 2 – Deciding on the mark**

Once the band has been decided, examiners can then assign a mark. During standardising (marking conference), detailed advice from the Principal Examiner on the qualities of each mark band will be given. Examiners will then receive examples of answers in each mark band that have been awarded a mark by the Principal Examiner. Examiners should mark the examples and compare their marks with those of the Principal Examiner.

When marking, examiners can use these examples to decide whether a candidate's response is of a superior, inferior or comparable standard to the example. Examiners are reminded of the need to revisit the answer as they apply the mark scheme in order to confirm that the band and the mark allocated is appropriate to the response provided.

Indicative content is also provided for banded mark schemes. Indicative content is not exhaustive, and any other valid points must be credited. In order to reach the highest bands of the mark scheme a learner need not cover all of the points mentioned in the indicative content but must meet the requirements of the highest mark band. Where a response is not creditworthy, that is contains nothing of any significance to the mark scheme, or where no response has been provided, no marks should be awarded.

Question		Marking details	Marks available					
			AO1	AO2	AO3	Total	Maths	Prac
12.		<p><b>Indicative content:</b></p> <p><b>Magnetic data</b> explained; vertical at poles and horizontal at Equator  Curie point - orientation of magnetic field of minerals in rocks aligned parallel to Earth's magnetic field at time of cooling  Gives position of pole and angle of inclination to indicate latitude  Angle of inclination changes in rocks of different ages  Some sediments may show evidence of magnetisation  Apparent polar wandering - determination of position of magnetic pole at time of cooling (remanent magnetism)  Positions of pole relative to continent gives latitude of continent at a particular time and shows changes over time .</p> <p><b>Sedimentary evidence</b> linked: deposits that are indicative of climatic zone.  Desert and hypersaline deposits in Devonian and Permo/Trias.  Carboniferous equatorial deposits (coal, limestones)  Jurassic tropical shallow marine deposits</p> <p><b>5-6 marks:</b>  A thorough understanding of how paleomagnetic evidence is preserved in rocks. Knowledge of the application of magnetic data to determine past positions of latitudes using palaeomagnetic evidence. Exemplification of sedimentary environments linked to latitudinal climatic zones using the British geological record.  <i>The candidate constructs a relevant, coherent and logically structured account including all key elements of the indicative content. A sustained and substantiated line of reasoning is evident and scientific conventions and vocabulary are used accurately throughout.</i></p>	6			6

			<p><b>3-4 marks:</b> A sound understanding of how palaeomagnetic evidence is preserved in rocks. Knowledge of the application of magnetic data to determine past latitudes using palaeomagnetic evidence. There may be exemplification of a sedimentary environment from the British geological record. <i>The candidate constructs a coherent account including many of the key elements of the indicative content and little irrelevant material. Some reasoning is evident in the linking of key points and use of scientific conventions and vocabulary is generally sound.</i></p> <p><b>1-2 marks:</b> A partial understanding of how palaeomagnetic evidence is preserved in rocks. There is some awareness of the application of magnetic data to determine past latitudes using palaeomagnetic evidence. The answer may be supported by generic examples of geological evidence. <i>Coherence is limited by omission and/or inclusion of irrelevant material. There is some evidence of appropriate use of scientific conventions and vocabulary.</i></p> <p><b>0 marks:</b> <i>The candidate does not make any attempt or give an answer worthy of credit.</i></p>

Question		Marking details	Marks available					
			A01	A02	A03	Total	Maths	Prac
15.		<p><b>Indicative content:</b></p> <p>Seismic wave velocities depend upon density, incompressibility and rigidity. With depth, incompressibility and rigidity increase at a greater rate than the increase in density. Thus P- and S-waves speed up (refraction). Seismic waves slow/refract back towards the normal in low velocity zone (LVZ) – marking asthenosphere. Lithosphere/asthenosphere boundary defined in terms of rock strength at the 1300°C isotherm.</p> <p><b>5-6 marks:</b></p> <p>A thorough understanding of the factors affecting seismic wave velocities relating to density and elastic properties, and their changes through the lithosphere and asthenosphere (LVZ) leading to slowing/refracting of waves. An appreciation of the distinction between lithosphere and asthenosphere is shown (e.g. rock strength, temperature, seismic properties).</p> <p><i>The candidate constructs a relevant, coherent and logically structured account including all key elements of the indicative content. A sustained and substantiated line of reasoning is evident and scientific conventions and vocabulary are used accurately throughout.</i></p>	6			6

				A01	A02	A03	Total	Maths	Prac
			<p><b>3-4 marks:</b> A sound understanding of the reduced seismic velocities and wave refraction in the LVZ and how these relate to the elastic properties of the mantle. Some reference to the distinction between lithosphere and asthenosphere is shown (e.g. rock strength, temperature, seismic properties). <i>The candidate constructs a coherent account including many of the key elements of the indicative content and little irrelevant material. Some reasoning is evident in the linking of key points and use of scientific conventions and vocabulary is generally sound.</i></p> <p><b>1-2 marks:</b> A partial understanding of the reduced velocities of seismic waves in the LVZ with limited links to wave refraction. Simplified understanding of how earthquake velocities relate to mantle properties. Some reference to the difference between the lithosphere and asthenosphere. <i>Coherence is limited by omission and/or inclusion of irrelevant material. There is some evidence of appropriate use of scientific conventions and vocabulary.</i></p> <p><b>0 marks:</b> <i>The candidate does not make any attempt or give an answer worthy of credit.</i></p>
